

You know that scene in a superhero movie where the villain dangles a kid over the edge of a building and (insert your superhero of choice) swoops in to catch them just in time?

Well, this is the cybersecurity version of that — with Gary Harlam's team at Technology Advisory Group saving the day for one of their customers.

The customer, a CPA firm, had just received an invoice for \$20,000 from one of their clients. It seemed like business as usual. The firm initiated the payment.

But at the same time, SaaS Alerts sent the Technology Advisory Group team the equivalent of the bat signal: the customer had been breached.

Gary's team immediately contacted them to stop the payment. Luckily, the firm's bank required a signature from the CEO for payments of that size, and he hadn't gotten to it yet.

Phew!

In the nick of time, the firm canceled the payment. Somewhere, a cybersecurity villain who thought they were \$20K richer punched the air in frustration.

That's the power of SaaS Alerts. We do the tedious, 24/7 monitoring and the automated alarm tripping — so you can swoop in to save your clients' SaaS.
