

RESPOND

AUTOMATED THREAT RESPONSE

Cover your SaaS even when you're asleep. Our advanced automation technology stops bad actors in their tracks without any human intervention required — 24/7/365.

Automated Cyber Attack Response

SaaS Alerts automatically responds to detected threats and account compromises, terminating active attackers, temporarily disabling the account and blocking new login attempts. Automated incident response occurs within minutes of detection and provides detailed forensic logs of compromised data and remediation steps.

“There’s constant security infrastructure in place. When I go offline, I know something else is there to keep an eye on the most critical components. In the morning, I may wake up and see a couple of attempts from hackers — but I know SaaS Alerts has already taken care of them.”

— Darren Nichol
Managing Director at pckwikfix

FEATURES

- Create rules based on a combination of SaaS Alerts events to automatically respond and secure user accounts
- Set rules for specific departments or accounts
- Initial response actions: Block sign-in, expire all logins, change password, require MFA on next login
- Get notified when a rule is triggered via email or mobile app
- Set rules to be active for a specific start/end date or to run in perpetuity

When a breach occurs, every minute counts. SaaS Alerts’ Respond module greatly reduces reaction time, allowing you to catch and stop breaches, preventing losses that typically follow an account compromise.
