CUSTOMER & PROSPECT REPORTS

How Does SaaS Alerts differ from MDR providers?

MDR providers rely on human “threat hunters” which are tasked with aggregating data from multiple sources and responding as quickly as possible, usually measuring response time in hours. SaaS Alerts provides alerting and remediation steps with actions taken **within seconds of malicious activity with no human interaction required.** This difference significantly minimizes the risk of data egress or malicious activity within your most vulnerable environments.

A Deeper Look into SaaS Alerts

MONITORING AND ALERTING

We use machine learning to aggregate and analyze user behavior in SaaS platforms. When unusual behavior is detected, you get an instant notification so you can take action fast.

24/7 DETECTION AND RESPONSE

SaaS Alerts automatically responds to detected threats and account compromises, temporarily disabling the account and blocking new login attempts. Automated threat mitigation occurs within minutes of detection and provides detailed forensic logs of compromised data and remediation steps.

SECURITY CONFIGURATIONS

Microsoft security recommendations are complex and require a lot of time to implement. With SaaS Alerts, you can apply security recommendations across all your users in minutes and receive alerts if your security score regresses.

BEYOND MICROSOFT 365

With our App Wizard, we can quickly integrate with any SaaS application with a viable API to pull mission-critical data into SaaS Alerts, so you can quickly detect and respond to SaaS security threats across almost all of your SaaS applications.

INTUITIVE REPORTING

Powerful reporting of user behavior and SaaS application events provides a comprehensive and timely view of the current state of SaaS security for your organization.
